Fast Ethernet Converters

perle.com/products/fast-ethernet-media-converters.shtm

Standalone, Unmanaged

- 100Base-TX to 100Base-FX Fiber Media Converters
- Extend network distances up to 120km
- SC, LC and ST Media Converters
- Advanced Features: Link Pass-Through, Far-End Fault, Auto-MDIX

Network Administrators can rest assured with Perle's advanced features such as Auto-Negotiation, Auto-MDIX, Link Pass-Through, Far End Fault, and Pause which make the end to end link completely transparent. This allows for more efficient troubleshooting and less on-site maintenance. These cost and time saving features, along with a lifetime warranty and free worldwide technical support, make **Perle's fast ethernet media converters** the smart choice for IT professionals.

Fast Ethernet Converter Features: 100Base-TX to 100Base-FX

| Auto- Negotiation (802.3u) | The media converter supports auto negotiation on the fast ethernet 100Base-TX interface. |
|----------------------------------|---|
| Auto-MDIX | Auto-MDIX (automatic medium-dependant interface crossover) detects the signaling on the 100Base-TX interface to determine the type of cable connected (straight-through or crossover) and automatically configures the connection when enabled. With Auto-MDIX enabled, either a straight-through or crossover type cable can be used to connect the media converter to the device on the other end of the cable. |
| Link Pass- Through | With Link Pass-Through the state of the 100Base-TX receiver is passed to the 100Base-FX transmitter to make the media converter appear transparent to the end devices that are connected. In addition if Far-End Fault is enabled the media converter can turn off the 100Base-TX transmitter when a FAR-End Fault is received. Using Link Pass-Through with Far-End Fault minimizes data loss when a fault occurs. Should a fault occur, the end devices have the indication of a failure available to them making trouble shooting easier. |

| Far-End Fault (FEF) | | | | | | | | |
|--|--|--|--|--|--|--|--|--|
| Pause (IEEE 802.3xy) | ause signaling is an IEEE feature that temporarily suspends data transmission between two evices in the event that one of the devices becomes overwhelmed. The fast ethernet media onverter supports pause negotiation on the 100Base-TX copper connection. | | | | | | | |
| VLAN | LAN The media converter is transparent to VLAN tagged packets. | | | | | | | |
| | Power | | | | | | | |
| Input Supply Voltage | 6 - 30 vDC, unregulated (12 vDC Nominal) | | | | | | | |
| Current | 167 mA | | | | | | | |
| Power Consumption | 2.0 watts | | | | | | | |
| Power 5.5mm x 9.5mm x 2.1mm barrel socket Connector | | | | | | | | |
| | Power Adapter | | | | | | | |
| Universal 100-240v AC, regulated DC adapter included AC/DC Adapter | | | | | | | | |
| | Indicators | | | | | | | |
| Power / TST | This green LED is turned on when power is applied to the media converter. Otherwise it is off. The LED will blink when in Loopback test mode. | | | | | | | |
| Fiber link on / Receive activity (LKF) | This green LED is operational only when power is applied. The LED is on when the 100Base-FX link is on and flashes with a 50% duty cycle when data is received. | | | | | | | |
| Copper link or / Receive activity (LKC) | This green LED is operational only when power is applied. The LED is on when the 100Base-TX link is on and flashes with a 50% duty cycle when data is received. | | | | | | | |
| | Switches - accessible through a side opening in the chassis | | | | | | | |
| Auto- Negotiation (B02.3u) Enabled (Default) - The media converter uses 802.3u Auto-negotiation on the 100Base-TX interface. It is set to advertise full duplex. Disabled - The media converter sets the 100Base-TX port to full duplex. | | | | | | | | |
| Pause | Pause should be enabled when all devices connected to the media converter support pause. Auto Negotiation must be Enabled to use this feature. Enabled (Default) - The Media converter will advertise Pause capability during Auto-Negotiation of the 100Base-TX interface. | | | | | | | |
| | Disabled - The Media converter will advertise that it does not have Pause capability during Auto-Negotiation on the 100Base-TX interface. | | | | | | | |

Link Pass Through

Enabled (Default) - When the state of the receiver is changed on the 100Base-TX interface it is reflected on the 100Base-FX fiber transmitter. When the state of the receiver on the 100Base-FX interface is changed it is reflected on the 100Base-TX transmitter.

When a Far-End Fault Indication is received on the fiber interface the 100Base-TX transmitter is turned off. When the Far-End Fault Indication is cleared the transmitter is turned back on.

Disabled - The 100Base-TX and the 100Base-FX fiber interface operate independently. Far-End Fault indication on the 100Base-FX fiber interface has no effect on the 100Base-TX interface.

Far-End Fault (FEF)

Enabled (Default) - The media converter transmits the Far-End Fault Indication over the 100Base-FX fiber connection whenever a receive failure is detected on the 100Base-FX fiber connection. The media converter continuously monitors the 100Base-X fiber connection and clears the Far-End

Fault Indication condition when a valid signal is received.

Disabled - Far-End Fault Indications are not transmitted regardless of the condition of the receive signal on the 100Base-FX fiber connection.

Remote Loopback

The media converter can perform a loopback on the 100Base-X fiber interface. Disabled (Default - Up)

Enabled - The 100Base-X receiver is looped to the 100Base-X transmitter. The 100Base-TX transmitter is taken off the interface.

Auto-MDIX (Internal Strap)

If Auto-Negotiation (802.3u) is enabled, the media converter uses the HP Auto-MDIX method for the 100Base-TX interface. If Auto-Negotiation (802.3u) is disabled the Media converter will use the RX Energy method on the 100Base-TX interface to set the port MDI or MDIX whichever is appropriate.

Enabled (Default) - Either a straight-through or crossover type cable can be used to connect the media converter to the device on the other end of the cable.

Disabled - If the partner device on the other end of the cable does not have the Auto-MDIX feature a specific cable, either a straight-through or crossover will be required to ensure that the media convertor's transmitter and the partner devices transmitter are connected to the others receiver. The Media Convertor's 100Base-TX port is configured as MDI with this switch setting.

100Base-TX RJ45 connector, 2 pair CAT 5, EIA/TIA 568A/B or better cable Magnetic 1.5kv Isolation Fiber Optic Multimode: 62.5 / 125, 50/125, 85/125, 100/140 micron Cable Single Mode: 9/125 micron (ITu-T 625) **Packet Transmission Characteristics**

^{*} When used with a Class B rated AC power adapter.

Fast Ethernet UTP Switch to UTP Switch

Extend the network distance between two twisted pair switches

Two Fast Ethernet Media Converters can extend the distance between UTP Switches across a fiber link up to 120km in length.

Fast Ethernet UTP Switch to Fiber Switch

Interconnect a UTP Switch with a Fiber Switch

A media converter can interconnect a UTP copper based Switch port to a remote switch that has integrated fiber.

Direct Connect - Long Distance

Direct Connection between two remote devices

With a pair of Fast Ethernet Media Converters two devices, such as file servers, can be connected up to 120km away across a fiber link.

Enterprise Infrastructure

Enterprise Infrastructure using Fiber Optics

Create a fiber infrastructure for your enterprise network without any wholesale replacement of existing copperbased equipment.

Single Mode / Single Fiber

Connect copper ports over a single fiber strand (also referred to as "Bi-Directional" BiDi)

When Single Strand fiber is used, a pair of Single Fiber Media Converters is needed for the copper to fiber conversion. Perle Single Fiber Media Converters are also referred to as "Up/Down" models. For example the S-100-S1SC20**U** ("Up") and S-100-S1SC20**D** ("Down"), shown below, must be used in pairs. An "**U**p" must be matched with a "**D**own" peer to deal with transmit and receive frequencies separately.

S-100-S1SC20US-100-S1SC20D

The majority of installations for single mode fiber media converters are of the "dual connector" or "dual fiber" type where one fiber connection is used for transmit, the other for receive. These are physically "crossed" to match up the Transmit/Receive links.

However, to reduce costs, or where there are limits on available fiber, WDM technology may be utilized. WDM uses separate transmit and receive frequencies to communicate on a single fiber strand. WDM technology relies on the fact that optical fibers can carry many wavelengths of light simultaneously without interaction between each wavelength. Thus, a single fiber can carry many separate wavelength signals or channels simultaneously.

So remember, if Single Strand fiber is used, you will need an **Up**" Media Converter on one side and a **'Down**" Media Converter on the other for copper to fiber conversion.

Perle offers a wide variety of Single Fiber ('Up/Down") Media Converters to connect 10BaseT, Fast Ethernet and Gigabit to single fiber. Whether you need Managed or Unmanaged, Standalone or Modular Chassis Based, 20km or 120km, Perle has the right model to meet your fiber conversion requirement.
